

JIA LI

(+86) 15195005057 | riga27527@gmail.com | <https://riga2.github.io/>

EDUCATION BACKGROUND

Shandong University

September 2022 - June 2025 (Expected)

Master of Software Engineering

- Avg Scores: 85.8/100
- Research interests: Computer graphics (mainly Rendering) / Neural rendering

Hohai University

September 2018 - June 2022

Bachelor of Computer Science

- GPA: 4.85/5.0 (Rank: 2/121)
- Main courses: Calculus, Linear Algebra, Discrete mathematics, Probability, Numeral Calculations, Data Structure, Operation System, Computer Graphics, Software Engineering, Algorithm.

PUBLICATIONS

(SIGGRAPH 2024 TOG) TensoSDF: Roughness-aware Tensorial Representation for Robust Geometry and Material Reconstruction

First Author

Project link: <https://riga2.github.io/tensosdf/>

- **More robust pipeline:** Use the surface roughness to incorporate the learning of radiance and reflectance fields, enabling the reconstruction of any reflective (diffuse/glossy/specular) objects robustly.
- **More detailed geometry:** Propose the TensoSDF - a new geometry expression that encodes the SDF with a tensorial representation, achieving more detailed surfaces and faster convergence.
- **More accurate material:** Propose a Mesh-SDF fusion strategy, achieving a higher quality of material estimation.

(CVPR 2024) Neural Super-Resolution for Real-time Rendering with Radiance Demodulation

First Author

Project link: <https://riga2.github.io/nsrd/>

- **Radiance demodulation:** Use the G-buffer information in the deferred rendering pipeline to decompose the radiance into the lower-frequency lighting component and the material component. Only perform the super-resolution on the lighting component, preserving more texture details in the scenes.
- **Frame-recurrent Network:** Integrate the previous and current frames to design a real-time super-resolution network, achieving better quality than other SOTA methods both qualitatively and quantitatively.

INTERNSHIP EXPERIENCE

Tencent

March 2024 - July 2024

Game Engine Development Intern

Shenzhen, China

Optimizations for the mobile rendering pipeline in UE4:

- 1) Optimize the Pipeline State Object (PSO) Caching, achieving $8\times$ faster scene loading on OpenGL ES and $3\times$ faster on Vulkan when the game first starts up;
- 2) Support Specular Anti-aliasing (SAA), removing the shiny artifacts on the high-curvature specular surfaces;
- 3) Propose an efficient, ghosting-free, and less flickering Temporal Anti-aliasing (TAA) method for mobile games;
- 4) Optimize the Bloom effects, achieving 0.2ms faster than the native implementation with a lower bandwidth.

HONORS & AWARDS

- Freshman Admission Scholarship of Shandong University - **First Prize** Oct. 2022
- The Mathematical Contest in Modeling (MCM) for American College Students - **Finalists Awards** Apr. 2020
- "China Software Cup" - College Student Software Design Competition - **First Prize** Oct. 2021
- Academic and Innovation Scholarships of Hohai University (Three times) Sept. 2019 & 2020 & 2021

MISCELLANEOUS

- Skills: C++, Python, Unreal Engine, Unity Engine, Blender, Vulkan, OpenGL
- Service: Reviewer for Pacific Graphics 2024
- Hobbies: Badminton, Video games, Traveling, Music, Movies
